

## Recommendation 1: High-Risk Patient Registry (Highest Priority)

### Finding:

Patients with prior inpatient admissions had significantly higher readmission rates.

### Recommendation:

Create a high-risk registry for diabetic patients with 2 or more prior inpatient admissions. Schedule follow-up calls within 7 days of discharge, review medication adherence, and ensure future appointments are booked before discharge.

### Expected Benefit:

Reduce avoidable readmissions

Focus limited staff resources on highest-risk patients

Improve continuity of care

## Recommendation 2: Enhanced Care Coordination for Complex Patients

### Finding:

Patients with multiple diagnoses accounted for a large share of readmissions.

### Recommendation:

Flag patients with multiple chronic conditions for enhanced care coordination, medication reviews, and multidisciplinary care planning.

### Expected Benefit:

Better management of complex patients

Fewer complications

Reduced readmission burden

## Recommendation 3: Emergency-Visit Intervention Program

### Finding:

Patients with multiple emergency visits showed substantially higher readmission rates.

### Recommendation:

Enroll frequent emergency users in chronic disease management programs focused on diabetes education, medication adherence, and early symptom recognition.

### Expected Benefit:

Reduce unnecessary emergency utilization

Improve disease control

Lower readmission risk

## Recommendation 4: A1C Monitoring Protocol

### Finding:

Patients without recorded A1C tests experienced higher readmission rates.

### Recommendation:

Implement a standardized diabetic monitoring protocol to ensure A1C testing is completed and documented during routine visits.

### Expected Benefit:

Better monitoring compliance

Earlier intervention

Improved patient management

## Recommendation 5: Elderly Patient Follow-Up Program

### Finding:

Patients aged 70–90 experienced the highest readmission burden.

### Recommendation:

Provide post-discharge monitoring, medication reviews, appointment reminders, and caregiver engagement for elderly diabetic patients.

### Expected Benefit:

Improved adherence

Reduced complications

Lower readmission rates
